                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    음
                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel nucleic acid (NA) encoding a nicotinic acetyl-choline receptor (I) from insects which can be used as an (insecticide. Inhibitors of (I) interfere with neurotransmission. (I) (also vectors containing it, its regulatory regions, and antibodies directed against (I)-encoded proteins) are used to screen for: (a) plant protection agents that alter conductance of ACNR, potentially useful as insecticides, or (b) genes which encode polypeptides that are involved in formation of functionally related ACNR in insects. (I) are also used to isolate and characterize the specified regulatory regions and for recombinant production of (II). This sequence encodes an acetyl-choline receptor isolated from Drosophila melanogaster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TTATTGATATTTTGAATTTATCTGCTAAGTTTGCCTAGCAGGATATCATGAAAAGAGA 1313

                                                                                                       a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel nucleic acid (NA) encoding a nicotinic acetyl-choline receptor (I) from insects which can be used as an insecticide. Inhibitors of (I) interfere with neurotransmission. (I) (also vectors containing it, its regulatory regions, and antibodies directed against (I)-encoded proteins) are used to screen for: (a) plant protection agents that alter conductance of AChR, potentially useful as insecticides, or (b) genes which encode polypeptides that are involved in formation of functionally related AChR in insects: (I) are also used to isolate and characterize the specified regulatory regions and for recombinant production of (II). This sequence encodes an acetyl-choline receptor isolated from Heliothus virescens

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57137-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       81
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21
                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175 and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                          detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             259 ACGAATATTTGGCTCAAATTGGAATGGAACGATATGAATCTTCGATGGAATTCGAGTGAG

2 cDNA clones (AAT59196 and AAT59197) respectively code for the alphal subunit (AAW12368) of chick neuronal alphabungarotoxin binding protein (ABBP). They were isolated from an 18-day embryo chick brain cDNA library using a probe (see also AAT59198) based

```
on the N-terminal amino acid sequence of chicken brain ABBP. The probe isolated partial clone pGDE29-1, which encoded the N-terminal portion of alphal. A subclone, pGD29-3 (ATCC 40641), was used to rescreen the library, yielding clone pGD3-1 (ATCC 40640), which encoded the enrire alpha2 sequence. A probe based on the C-terminal region of pGD3-1 was used obtain clone pCD3-1 (ATCC 40639), encoding the C-terminal portion of alpha1. The cDNA clones can be used as probes to identify further ABBP subunits, and in the recombinant prodn. of ABBP

```
receptor (NAChR) subunit. The cells expressing the alpha and/or beta NAChR subunits may be used in a method of screening compounds to identify any which modulate the activity of human neuronal NAChR. Subunit specific antibodies may be used to monitor the distribution and expression density of various subunits in normal vs diseased brain tissues. Testing of single receptor subunits combinations with a variety of potential agonists or antagonists provides information with respect to the function and activity of the individual subunits and should lead to the identification and design of compounds that are capable of very specific interaction with one or more receptor subtypes. The resulting drugs should exhibit fewer unwanted side effects than drugs identified e.g. screening with cells that express a variety of subtypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                VallysAspLeuArgValProProHisArgLeuTrpLysProAspValLeuMetTyrAsn 124

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A DNA sequence (AAT48239) codes for the alpha-7 subunit (AAW09025) of the human neuronal nicotinic acetylcholine receptor (nAChR). Host cells, esp. mammalian cells or amphibitan ocoytes, carrying alpha-7 nucleic acids, opt. in combination with other alpha and/or beta subunit nucleic acids (see also AAT48232-38, AAT48240-41), express recombinant nAChR subunits useful for identifying cpds. that modulate the activity of human nAChRs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         --SerHisLeuAlaAla--- 12

Identifying antagonists or agonists of human neuronal nicotinic acetylcholine receptors, by contacting recombinant cells with test compound, and measuring ion flux of cells or binding of compound to Identifying

57-60; 56pp; English Claim 101; Col

The invention relates to a method for identifying compounds that are antagonists or agonists of human neuronal nicotinic acetylcholine receptors (NAVChNS), by contacting recombinant cells with a test compound and measuring ion flux, the electrophysiological response of the cells or binding of the test compound to the nNAChR. The recombinant cells are produced by transfection with a nucleic acid encoding at least one human nNAChR (alpha or beta) subunit, such that the cells express an nNAChR comprising one human subunit encoded by the transfected nucleic acid. This sequence represents cDNA encoding the alpha 7 subunit of the human nNAChR polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a suitable host cell transfected with an isolated nucleic acid molecule comprising a sequence of nucleotides or ribonucleotides that encodes at least one alpha or beta subunit of a human neuronal nicotinic acetylcholine receptor (NACHR). The compositions and methods of the present invention, which provide a means to prepare synthetic or recombinant receptors and receptor subunits that are substantially free of contamination from many other receptor proteins, are useful for observing the effect of a drug substance on a particular subtype to perform in vitro screening of the drug substance in a test system that is specific for humans. The antibodies can be used in immunochemistry and for diagnostic and therapeutic applications. The present sequence represents a human neuronal NACHR alpha7 subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cell comprising nucleic acids encoding human alpha and beta subunits of neuronal nicotinic acetylcholine receptors, useful for in vitro screening of a drug substance in a test system specific for humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9

nicotinic acetylcholine receptor (nAChR), useful for identifying
that modulate human neuronal nAChR activity.
                                                                  The invention relates to an isolated nucleic acid molecule comprising a neucleotide sequence encoding an alpha 6 or a beta 3 subunit of a human neuronal nicotinic acetylcholine receptor naChR. nAChR's form ligandgated ion channels that mediate synaptic transmissions between nerve and muscle and between neurons upon interaction with the neurotransmitter compounds that modulate human neuronal naChR. The present sequence represents DNA encoding the human neuronal nicotinic acetylcholine receptor, nAChR, alpha 7 subunit. Note: the present sequence decodes to the protein shown in ADA10874 not the one described in the specification as being the nAChR alpha 7 subunit ADA10865.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   121 CTGCACGTGTCCCTGCAAGGGGAGTTCCAAGGATTACAAGGAGCTGGTCAAGAAC 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     360

The present invention describes an isolated antibody that binds to one of the human PRO proteins designated PRO212, PRO290, PRO341, PRO355, PRO1025, PRO1030, PRO4019, PRO4019, PRO1025, PRO1030, PRO40197, PRO10197, PRO1197, PRO10197, PRO10184, PRO10187, PRO10184, PRO20184, PRO21987, PRO20198, PRO20198, PRO10184, PRO10184, PRO10184, PRO10187, PRO10184, PRO10184, PRO10187, and prevention of cancer. The antibodies and other anti-tumour compounds and prevention and/or activation of the amplified PRO genes. Exemplary conditions or disorders to be treated with such antibodies and other compounds include benign or malignant tumours (e.g., renal, liver, conditions or disorders to be treated with such antibodies and other compounds, and various head and neck tumours), leukaemias and conformal and blastocoelic disorders, and inflammatory, angiogenic and etromal and blastocoelic disorders, and inflammatory, angiogenic and compounds inmunoledic disorders. AACS824C to AACS836 represent PRR primers and hybridisation probes used in the isolation of the human PRO sequences. Proceedant invention

```
cell lines to conduct calcium ions, comprising specified concentrations of ions of sodium, calcium and potassium at specified pH.
```

Example 5; Page 60-61; 77pp; English.

The present sequence is the coding sequence for wild-type human alpha7 nicotinic acetylcholine gated ion channel. The human alpha7 ion channel was used in the construction of an alpha7/5-hydroxytryptamine (5-HT3) chimeric ligand gated ion channel (see AAG90382 and ABB50014). The alpha7/5-HT3 chimeric ion channel can be expressed by recombinant cells in the present invention, resulting in preferential calcium ion conductance by the cells

```
This sequence encodes the V247T variant of human alpha7 nicotinic acetylcholine receptor (nAchR) subunit of the invention. Cells containing the DNA are used to express the protein and to identify modulators of alpha7 nAchR activity or cytoprotective agents, e.g. antisense compounds or antagonists that are potentially useful for treating neurogeneration, enzyme dysfunction, affective disorders and immune dysfunction, such as cancer, post-herpetic neuralgia, diabetic convergence as cancer, post-herpetic neuralgia, diabetic convergathy, osteoarthritis, Alzheimer's or Parkinson's diseases, kuru, cypychocais and schizophrenia. Probes based on the DNA are used to detect the DNA in usual hybridisation or amplification tests, while emonolonal antibodies are used to detect the protein for diagnosis (in vitro or by in situ immuno-fluorescent assay). Compared with wild-type alpha7 nAchR, the protein has about 100-fold greater sensitivity to cholinersein conceptor agonists (nicotine or acetylcholine) and response to these
                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid encoding variant of human alpha 7 nicotinic acetyl-choline receptor sub-unit - used to identify modulators of the receptor, potentially useful for treating neuro-degeneration, cancer etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the coding sequence for a mutant human alpha7 nicotinic acetylcholine gated ion channel. The human alpha7 ion channel was used in the construction of an alpha7/5-hydroxytryptamine (5-HT3) chimeric ligand gated ion channel (see AAC90382 and AAB50014). The alpha7/5-HT3 chimeric ion channel can be expressed by recombinant cells in the present invention, resulting in preferential calcium ion conductance by the cells. The protein encoded by this sequence has the wild-type threonine residue at position 230 substituted by a proline

SUBCELLULAR LOCATION: Integral membrane protein.
MASS SPECTROMETRY: NW=54157.68; METHOD=MALDI.
SIMILARITY: Belongs to the ligand-gated ionic channel family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chini B., Raimondi E., Elgoyhen A.B., Moralli D., Balzaretti M.,

Alpha-Bungarotoxin-sensitive nicotinic receptors on bovine
chromaffin cells: molecular cloning, functional expression and
alternative splicing of the alpha 7 subunit.",
Furction: After binding acceptionine, the AChR responds by an
extensive change in conformation that affects all subunits and
leads to opening of an ion-conducting channel across the plasma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

Submitted (AUG-1998) to the EMBL/GenBank/DDBJ databases.
Submitted (AUG-1998) to the EMBL/GenBank/DDBJ databases.
Submitted (AUG-1998) to check actylcholine, the AChR responds by an extensive change in conformation that affects all subunits and leads to opening of an ion-conducting channel across the plasma
                                                                                                                                                                                                                                                                                                                                                                                        similarity).
SUBCELLULAR LOCATION: Integral membrane protein.
SIMILARITY: Belongs to the ligand-gated ionic channel family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ASSOCIATED WITH RECEPTOR ACTIVATION

Submitted (SEP-1997) to the EMBL/GenBank/DDBJ databases.
- FUNCTION: Possible acetylcholine receptor.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to the ligand-gated ionic channel family.
                                                                                                                                                                                                                                                                                                                  STRAIN=Bristol N2;

C. -- FUNCTION: After binding acetylcholine, the AChR responds by an extensive change in conformation that affects all subunits and leads to opening of an ion-conducting channel across the plasma membrane (By similarity).
C. -- SUBCELDULAR LOCATION: Integral membrane protein.
C. -- SIMILARITY: Belongs to the ligand-gated ionic channel family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Manduca sexta (Tobacco hawkmoth) (Tobacco hornworm).

Esquence and functional expression of a single alpha subunit of an insect nicotinic acetylcholine receptor.";
EMBO J. 9:4391-4398(1990).
-!- FUNCTION: After binding acetylcholine, the AChR responds by an extensive change in conformation that affects all subunits and leads to opening of an ion-conducting channel across the plasma
